

Duo: Two-Factor Authentication at the Push of a Button

Essentials

- User-friendly
- Cloud-based
- Remote control
- Self-enrollment
- Quick and easy implementation

Duo is a two-factor authentication (2FA) solution designed with users in mind. It provides next-level 2FA protection with remote access controls while being lightweight on system resources and user-friendly.

Simple and user-friendly. Duo's two-factor authentication does not require a second set of logins. Simply login on your workstation, open the Duo app on your smartphone, click "Approve" and you are logged in.

Tailored. Users can choose from a menu of second factors: using their smartphones and clicking "Approve," typing in a passcode, requesting a phone call or using a token.

Cloud-based. Duo is cloud-based, making implementation easier and faster than traditional 2FA. User self-enrollment makes on-boarding much more efficient.

Trusted Access. Duo ensures users are trusted and devices are clean of malware before they access your network and applications.

Vigilant. Duo provides powerful reporting tools that give administrators the ability to view logs, monitor and adjust user access and receive fraud alerts.

Informative. Duo's Admin Dashboard provides quick overviews of user devices with analysis and device update notifications.

Secure. Duo gives administrators the power to set custom security and access controls.

Add Duo to your security framework and ensure users and devices are trusted before they access your network.
